| Command  | Description                      | Output                    |
|----------|----------------------------------|---------------------------|
| Useradd  | To be able to use the useradd    | useradd -m -d/opt/hritik  |
|          | command and create new           |                           |
|          | users you need to be logged in   |                           |
|          | as root or a user with sudo      |                           |
|          | access.                          |                           |
| Usermod  | After creating user accounts, in | usermod -d /var/www/      |
|          | some scenarios where we          | tecmint                   |
|          | need to change the attributes    |                           |
|          | of an existing user such as,     |                           |
|          | change user's home directory,    |                           |
|          | login name, login shell,         |                           |
|          | password expiry date, etc,       |                           |
|          | where in such case 'usermod'     |                           |
|          | command is used.                 |                           |
| Userdel  | The userdel command              | sudo userdel -f neuser    |
|          | modifies the system account      |                           |
|          | files, deleting all entries that |                           |
|          | refer to the user name LOGIN.    |                           |
|          | The named user must exist.       |                           |
| Groupadd | groupadd command creates a       | groupadd -g 9090 newgroup |
|          | new group account using the      |                           |
|          | values specified on the          |                           |
|          | command line and the default     |                           |
|          | values from the system. The      |                           |
|          | new group will be entered into   |                           |
|          | the system files as needed.      |                           |
| Groupdel | The groupdel command             | groupdel -f /etc/newGroup |
|          | modifies the system account      |                           |
|          | files, deleting all entries that |                           |
|          | refer to group. The named        |                           |
|          | group must exist.                |                           |
| Groupmod | Groupmod: The groupmod           | groupmod -n oldgroup      |
|          | command modifies the             | newgroup                  |
|          | definition of the specified      |                           |
|          | GROUP by modifying the           |                           |
|          | appropriate entry in the group   |                           |
|          | database.                        |                           |
